**Hiring Team**

**Bionorica SE**

**Subject:** Application for Full Stack Engineer (TypeScript, Vue/Nuxt, Node.js)

Dear Hiring Team,

I am applying for the Full Stack Engineer role at Bionorica SE. I build modern web applications with a strong focus on TypeScript across Vue.js/Nuxt frontends and Node.js backend services. I am especially interested in internal platforms and workflow applications where reliability, security, and maintainability are essential.

My background combines formal German vocational education with hands-on delivery in a production environment. I completed a structured vocational retraining program in software development in Germany (Fachinformatiker, Application Development). This program is a practice-oriented qualification focused on real-world engineering skills and project work. During my training, I completed an 18-month full stack internship where I delivered multiple web projects end-to-end and maintained live systems.

What I bring that matches your role:

- Frontend: Vue.js and Nuxt with TypeScript, scalable component-based UI and clean page flows.
- Backend: Node.js + TypeScript APIs with clear contracts, validation, and pragmatic error handling.
- Enterprise mindset: integration work, maintainable structure, and stable behavior after updates.
- Delivery: Git workflows, collaboration with product and UX, and comfort working in an agile cadence.
- Quality focus: performance awareness and practical application security considerations.

I would welcome the opportunity to discuss how I can contribute to Bionorica SEs digital product team and support your enterprise platforms and modern web systems.

Sincerely,

Markus Tratschitt
